

# BU 300 + IBC 150 + S 500:

## Solida packaging in bottles and connecting serialization.

### Solid packaging bottle line from Uhlmann – precise, seamless, safe.

The bottle line integrates all steps in an end-to-end packaging process: from unscrambling and cleaning the bottles, counting and filling them with solid products, desiccant or cotton wad, to labeling and serialization. The line can, of course, be continued on a customer-specific basis with suitable cartoners and end-of-line packaging systems including aggregation with the Uhlmann Track & Trace solution. In terms of Smart Production, the manufacturer-independent Pexcite software platform networks the entire packaging line. The complete solution shown, consisting of the BU 300 bottle unscrambler, the IBC 150 bottle line and the S 500 serialization platform, is perfectly coordinated. As a highlight, the single tablet rejector checks tablets already in the counting system, detects damaged products, and rejects them – all to ensure a minimum of waste. Another innovation is the first metal detector integrated into a monoblock, which checks bottles for foreign particles before they are closed.
